AGRO Ex cable glands.

Professional cable glands for potentially explosive atmospheres.

Explosion protection.

Necessary more frequently than you might think.

In the 19th century, electrical technology made its way into both industry and the home. Immediately thereafter, the first fundamentals for protection against electrical explosions were developed because of the methane gas and coal dust which arose during the mining of anthracite coal. The advantages of electricity were so overwhelming that people started working intensively to come up with ways to prevent any possible meeting of explosive atmospheres and ignition sources – resulting from the use of electrical equipment – and in this way could avoid explosions.

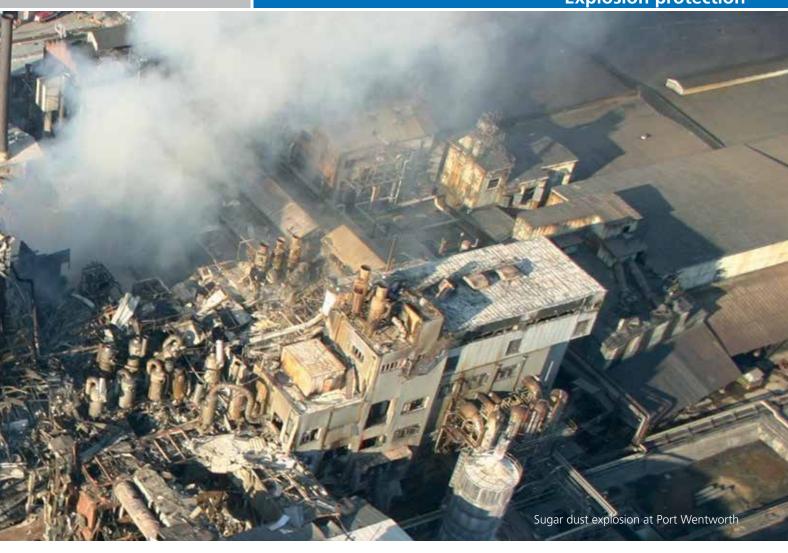

This application in mining was just the start. The chemical and petrochemical industries as well as oil and gas extraction represent more application areas where explosion-proof equipment is needed. Additionally, organic chemistry, the paint and varnish industry as well as the pharmaceuticals industry all process and work with flammable liquids and gases. And today even more application areas are constantly emerging, for instance with the extraction and use of biogas or the ecological use of disposal sites and landfills. In the processing of wood and grain there are yet more potential sources of danger. The use of hydrogen is being discussed intensively, and here, too, this will lead to various applications requiring explosion protection.

Anyone who is involved professionally with industrial systems must now be very conscious about the topic of explosion protection. In many industries, gases, vapours or mists build up or escape during the manufacture, processing, transport or storage of combustible materials, and these are released into the environment. Combustible dust is created in other processes. When these are combined with oxygen in the air, a hazardous atmosphere can build up which if ignited results in an explosion.

Explosion protection is governed by the legislation of individual countries around the world. Differences in technical requirements specific to each country and the required permits for explosion-proof equipment place high requirements on manufacturers, especially those with global operations, and these result in high costs for product development and approvals processes. In the wake of globalisation, though, it has been possible to make great strides towards uniform policies for explosion protection.

In Europe, since 1 July 2003 only equipment, components and protective systems intended for use in potentially explosive atmospheres can be placed on the market if they meet the requirements of the ATEX 94/9/EC equipment directive, whose goal is preventing serious damage to persons and installations.

Directives and regulations

ATEX 95 (Directive 94/9 EC)

With ATEX product directive 94/9/EG (ATEX 95) and ATEX operating directive 1999/92/EG (ATEX 137), the European Union laid the foundation for harmonised European explosion protection. This safety concept applies to both the manufacture of electrical and non-electrical equipment and the operation of such units in the affected industrial systems.

The legislatures of the individual member states implement these directives with corresponding laws.

IECEx

The international IECEx scheme likewise serves for the conformity assessment and certification of equipment, systems and services for use in potentially explosive atmospheres.

Introduced in 1996, the IECEx system supports the international harmonisation of standards and the issue of country- and region-neutral certificates of conformity (CoC) to simplify the free movement of goods around the world. There is already an extensive agreement between the European ATEX directives and the IECEx regulations as regards classes and requirements. This all means that ATEX could one day be replaced.

In those countries which recognise IECEx, certified equipment, apparatus and systems can be put into service without additional tests.

Today, IECEx is recognised not only in Europe but in many additional countries including Australia, New Zealand, Brazil, Canada, China, Japan, Korea, Malaysia, Singapore, South Africa, USA...

You can find further information about the IECEx system and its rules as well as regulations, handbooks and procedures at www.iecex.com.

"Equipment" refers to machines, apparatus, fixed or mobile devices, control components and instrumentation thereof and detection or prevention systems which, separately or jointly, are intended for the generation, transfer, storage, measurement, control and conversion of energy for the processing of materials and which are capable of causing an explosion through their own potential sources of ignition.

"Components" refers to any item essential for the safe functioning of equipment and protective systems but with no autonomous function.

An "explosive atmosphere" is a mixture with air, under atmospheric condi-tions, of flammable substances in the form of gases, vapours, mists or dusts in which, after ignition has occurred, combustion spreads to the entire unburned mixture.

A **"potentially explosive atmosphere"** is one which could become explosive due to local and operational conditions.

The manufacturer must take great care to provide sufficient information and instructions necessary for the proper operation and maintenance of equipment.

Prerequisites for certification

With an Annex, ATEX95 defines various modules for the commercialisation of equipment intended for use in potentially explosive atmospheres. Modules III and IV are often used and applied at AGRO as well, and from them two certificates result:

• EC type-examination certificate

QS approval

Both certificates are issued by accredited testing facilities after tests have been successfully completed.

EC type-examination certificate

The EC type-examination certificate is the document which is issued based on successful technical testing.

QS approval

A requirement of ATEX95 is production which has been tested and is monitored. It ensures that products placed on the market are identical with the test samples used for the EC type-examination certificate. For companies which have a certified QM system conforming to ISO 9001:2000, an additional Ex audit is not necessary. Repeat audits follow at regular intervals.

CE declaration of conformity

The CE declaration of conformity is based on the EC type-examination certificate and QS approval. With it, a manufacturer declares that it has observed all applicable standards, instructions and regulations. This is made visible with the CE symbol, which is a part of the marking.

Standards

Numerous standards which address explosion protection exist around the world. The scope of standards is, however, subject to continuous updates which reflect technical advances and increased societal requirements regarding safety. International harmonisation efforts around the world have as their goal globally unified safety standards to help break down trade barriers.

Equipment is differentiated by the corresponding series of standards:

IEC/EN 60079 for electrical equipment (gases, vapours and dust) EN 13463 for non-electrical equipment (will in future be replaced by EN 80079)

Which type of ignition protection a manufacturer selects depends on the type and intended function of the equipment. All standardised types of ignition protection within a given category are equivalent. A manufacturer confirms with the EC type-examination certificate, which belongs to the technical documentation, that its product conforms to ATEX directives.

Certification

Equipment intended for use in potentially explosive atmospheres may only be brought to market if they have undergone the conformity assessment procedures dictated in the directives. For equipment, certification must be conducted by a designated testing facility. EC type-examination certifications from a designated European testing facility are recognised within the entire EU.

Conditions for an explosion

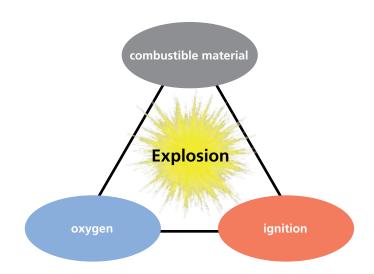

As a rule, an explosion can only take place in atmospheric air if three factors come together:

- a flammable material
- oxygen (in the air)
- ignition source

The first two factors – flammable material and air – must be present in a corresponding concentration so that they can form an explosive atmosphere.

Descriptions of explosion protection are thus in general limited to the depiction of reactions with oxygen in air. Oxidation reactions which are generally associated with the generation of heat and pressure fulfil the criteria for an explosion.

Hazardous areas for explosions can develop in manufacturing facilities and workplaces. Typical hazardous areas arise in chemical factories, refineries, paint factories, paint shops, cleaning systems, mills/warehouses for milled products, commercial bakeries and other places with combustible dusts, in tank farms and loading facilities for combustible gases, liquids and solids.

What protective measures can be taken to reduce the danger of explosion?

- avoid combustible substances
- inerting (addition of nitrogen, carbon dioxide, etc.)
- limiting concentration levels
- improved ventilation
- secondary explosion protection is necessary if the danger of explosion cannot be ruled out through primary explosion protection measures

Equipment marking

The following can be identified from the marking of electrical equipment for hazardous areas:

- · equipment manufacturer
- a designation from which it can be identified
- the area of use: underground I
 - other areas II
- the categories which indicate if the device can be used in certain areas
- the type(s) of ignition protection which the equipment fulfils
- the overall identification of the certificate

M – this prefix stands for underground mines

G – this suffix stands for combustible gases, mists or vapours

D – this suffix stands for dust

Numerals express the degree.

Equipment category 1 very high degree of safety high degree of safety equipment category 3 very high degree of safety normal degree of safety

Equipment protection level a very high degree of protection and thus a very high degree of safety

Equipment protection level b high degree of protection and

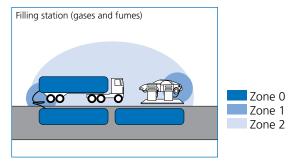

thus a high degree of safety

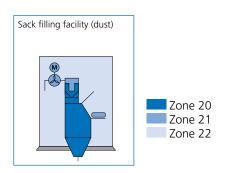

Equipment protection level c normal degree of protection and

thus an increased level of safety

This results in the assignment of the equipment categories to the zones.

Examples for zone assignment in the Ex area

Zone assignment										
			Dust							
	Zone 0	Zone 1	Zone 2	Zone 20	Zone 21	Zone 22				
Frequency of explosion hazard	continually or long-term	occasionally	seldom and short- term	same as Zone 0 Dust deposits alone do not make up Zone 20	same as Zone 1	same as Zone 2 or if accumulations of dust are present				
Frequency of ignition sources from electrical equipment	never (even not during seldom operating malfunctions)	very seldom (even not if frequent operating malfunctions can be expected)	gelegentlich (z.B. bei Betriebsstörung)	same as Zone 0	same as Zone 1	same as Zone 2				

Equipment assignment by zone										
Area	Level of the danger of	Required marking on equipme	ent to be used							
	explosion	Equipment group*	Category							
Group II	Zone 0	II	1 G							
Group II	Zone 1	П	2 G or / 1 G							
Group II	Zone 2	II	3 G or / 2 G							
Group II	Zone 20	П	1 D							
Group II	Zone 21	II	2 D or / 1 D							
Group II	Zone 22	Ш	3 D or as in / 2 D							

^{*} Equipment is divided into two groups. Group 1 applies to equipment for use in mining and subject to firedamp environments and will not be further discussed here.

For Group II equipment a further subdivision is made into explosion groups and temperature classes.

Assignment in temperature classes									
Temperature class	Ignition tempe- rature	Max. surface temperature of the equipment							
T1	≧ 450 °C	450 °C							
T2	300-450 °C	300 °C							
T3	200-300 °C	200 °C							
T4	135-200 °C	135 ℃							
T5	100-135 °C	100 °C							
T6	85-100 °C	85 °C							

Explosion groups

Within the explosion groups, for electrical equipment a first distinction is made between Equipment Group I and Equipment Group II. Electrical equipment in Equipment Group I is used for mines susceptible to firedamp.

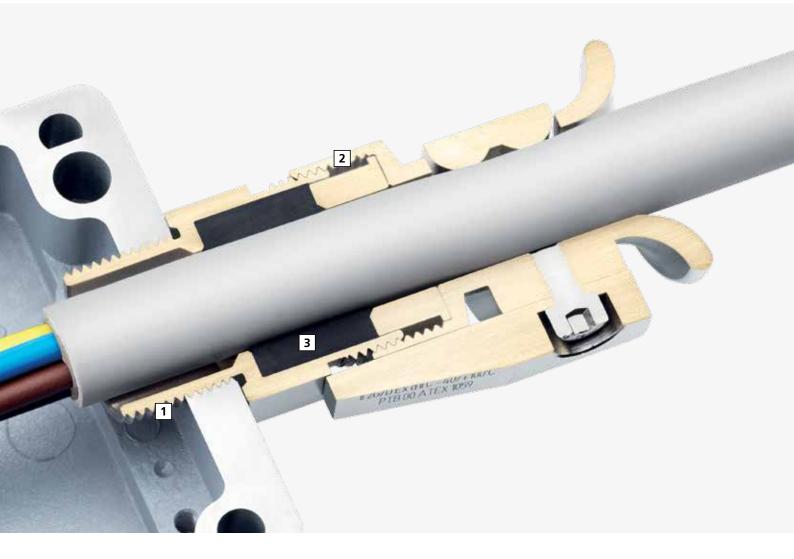

For electrical equipment in Equipment Group II, a further subdivision is made into explosion groups. The subdivision depends on the

maximum experimental

safe gap (MESG) and the minimum ignition current.

Electrical equipment with approval for Explosion Group IIC may also be used in Explosion Groups IIA and IIB. Electrical equipment in Equipment Group III is likewise subdivided into further explosion groups.

Explosion groups										
Equipment group	Application examples	Gas/dust group	Explosion group	MESG with flameproof enclosure						
Group I	Electrical equipment for mines susceptible to firedamp → Firedamp protection ExI									
	Electrical equipment for areas	IIA (e.g. propane)	IIA	> 0.9 mm						
Group II	which are hazardous due to explosive gases	IIB (e.g. ethylene)	IIB	0.5 bis 0.9 mm						
	→ Explosion protection ExII	IIC (e.g. hydrogen)	IIC	< 0.5 mm						
	Electrical equipment for areas which are	IIIA (e.g. combustible flakes)	IIIA							
Group III	Electrical equipment for areas which are hazardous due to explosive dust	IIIB (e.g. non-conductive dust)	IIIB							
	→ Explosion protection ExIII	IIIC (e.g. conductive dust)	IIIC							

Flameproof enclosures Ex d IIC and increased safety Ex e II

Principle

With ignition protection type Ex d IIC, components which can ignite an explosive atmosphere are arranged in a housing. This housing must contain the pressure of the explosion and an explosive mixture within itself, and it must prevent the explosion from spreading to the explosive atmosphere surrounding the housing.

Important design parameters

- The mechanical stability must correspond to that of a predetermined safety factor against internal explosion pressures.
- Gaps between two parts of a housing must be designed sufficiently long and narrow that exiting hot gas cannot ignite an explosive atmosphere which might be present in the hazardous area.
- The parameters for the gaps preventing an arc-through, width/ length, are different for Explosion Subgroups IIA, IIB and IIC. The highest requirements on gap parameters are placed on the housings of Explosion Subgroup IIC.

Applications

• Equipment which during normal operation can generate sparks or electric arcs and/or hot components; this includes switchgear and circuit breakers, controls, motors, transformers, slip rings, collectors, regulating resistors, fuses, lighting fixtures, heating cartridges and friction brakes.

Cable glands for flameproof enclosures are tested according to IEC/ EN 60079-1 for the following points:

- mechanical design and pressure testing
- electrical and thermal behaviour

1 Entry threads

Long entry threads in metric, Pg, gas pipe or NPT designs provide maximum safety with respect to the quality of attachment.

2 Spanner surfaces

Large, solid spanner surfaces on the pressure nut and bottom section allow safe tightening with the assembly tool.

3 Guaranteed sealing capability

The ingenious sealing insert and matching inner contours ensure a targeted deformation of the insert and thus guarantee its tightness. Protection Class IP68 (30 bar) facilitate optimal usage.

Flameproof enclosures Ex d IIC and increased safety Ex e II

For a description of the protection type of flameproof enclosures, please see Page 8 of this brochure.

Ex e II principle

In the case of ignition protection with an increased safety type, operation is based on the equipment preventing ignition of the explosive atmosphere which can also leak into the housing. The equipment may not reach temperatures which are above the temperature class of gases which could potentially arise in the place of use, and sparks caused by electrical or mechanical means may also not occur. In electrical machines, electrical-thermal testing is thus of particular importance. In operation, protection against overloading is essentially important to maintaining explosion protection.

Important design parameters

- There are special protection requirements for non-insulated active components.
- Air and creepage gaps are dimensioned larger than is generally the case in industry. Special requirements apply to the IP protection classes which must be maintained.
- More stringent requirements apply to windings with mechanical stability and insulating capacity, and the windings must be protected against elevated temperatures.

Applications

 Installation materials such as junction boxes and distribution boxes, terminal compartments for heaters, storage batteries, transformers, inductive ballasts, electrical motors, squirrel cage induction motors, lighting fixtures.

Cable glands for increased safety are tested according to IEC/EN 60079-7 for the following points:

- mechanical design
- electrical-thermal testing

1 Entry threads

Long entry threads in metric designs allow maximum safety with respect to the quality of attachment.

2 Compact design

The compact design allows space-saving assembly on equipment, and the large clamping range reduces the number of different types.

3 Guaranteed sealing capability

The ingenious sealing insert and matching inner contours ensure a targeted deformation of the insert and thus guarantee its tightness. Protection Class IP68 (30 bar) facilitate optimal usage.

Increased safety Ex e II

Principle

In the case of ignition protection with an increased safety type, operation is based on the equipment preventing an ignition of the explosive atmosphere which can also leak into the housing. The equipment may not reach temperatures which are above the temperature class of gases which could potentially arise in the place of use, and sparks caused by electrical or mechanical means may also not occur. In electrical machines, electrical-thermal testing is thus of particular importance. In operation, protection against overloading is essentially important to maintaining explosion protection.

Important design parameters

- Special protection requirements for non-insulated active components.
- Air and creepage gaps are dimensioned larger than is generally the case in industry. Special requirements apply to the IP protection classes which must be maintained.
- More stringent requirements apply to windings with mechanical stability and insulating capacity, and the windings must be protected against elevated temperatures.

Applications

Installation materials such as junction boxes and distribution boxes, terminal compartments for heaters, storage batteries, transformers, inductive ballasts, electrical and squirrel cage induction motors, lighting fixtures. Cable glands for increased safety are tested according to IEC/EN 60079-7 for the following points:

- mechanical design
- electrical-thermal testing

1 Short, long or special entry threads

Progress® cable glands with short or long entry threads in metric or Pg designs can be used with existing threads or, in the case of drilled through holes, with locknuts.

2 Visible safety

The small bead on the sealing insert confirms the proper tightening torque.

3 High distortion protection

The integrated retaining grooves in the lower part and in the sealing insert ensure protection against twisting.

4 Guaranteed sealing capability

Inner contours matched to the sealing insert ensure a targeted deformation of the insert and thus guarantee its tightness. Protection Class IP68 to 10 bar as well as IP69K allow a wide range of uses.

AGRO cable glands Progress® nickel-plated brass increased safety Ex e II

Designation: Progress MS EX **Material:** nickel-plated brass

Seal: TPE

one-piece sealing insert, not overall length insulated

Temperature range: -40°C / +100°C

Protection class: IP 68 (bis 10 bar) / IP 69K

Test standard: see page 12 **Category 2G:** Ex e II

Category 2D: Ex tD A21 IP68

Zone: Gas 1 and 2 / dust 21 and 22

Certificate: EC-type examination certificate PTB 02 ATEX 1126X

Long entry thread

EMC cable gland Series 85 with clamps increased safety Ex e II $\,$

Increased safety Ex e II

Principle

In the case of ignition protection with an increased safety type, operation is based on the equipment preventing an ignition of the explosive atmosphere which can also leak into the housing. The equipment may not reach temperatures which are above the temperature class of gases which could potentially arise in the place of use, and sparks caused by electrical or mechanical means may also not occur. In electrical machines, electrical-thermal testing is thus of particular importance. In operation, protection against overloading is essentially important to maintaining explosion protection.

AGRO combination conduit glands provide an optimal mix if you want to feed cables inside a conduit into an enclosure and at the same time want a secure seal and strain relief for the cables.

Attention!

Only metallic or metal-braided conduits may be applied!

Important design parameters

- There are special protection requirements for non-insulated active components.
- Air and creepage gaps are dimensioned larger than is generally the case in industry. Special requirements apply to the IP protection classes which must be maintained.
- More stringent requirements apply to windings with mechanical stability and insulating capacity, and the windings must be protected against elevated temperatures.

Applications

For installations where cable protection is important such as metal-working ma-chines or where mechanical damage can occur or effects due to weather must be excluded.

Conduit glands for increased safety are tested according to IEC/EN 60079-7 for the following points:

- mechanical design
- electrical-thermal testing

1 Short entry threads, metric

Progress® cable glands with short entry threads can be used with existing screw threads.

2 Grounding

The screened tap connection is accomplished with a brass contact sleeve instead of the gasket (3a) over 360°.

3 Guaranteed sealing capability

The sealing capability of the combination conduit gland is ensured not only between the conduit and the conduit gland (3a) but also through the sealing insert in the cable gland (3b) at the entrance into the housing.

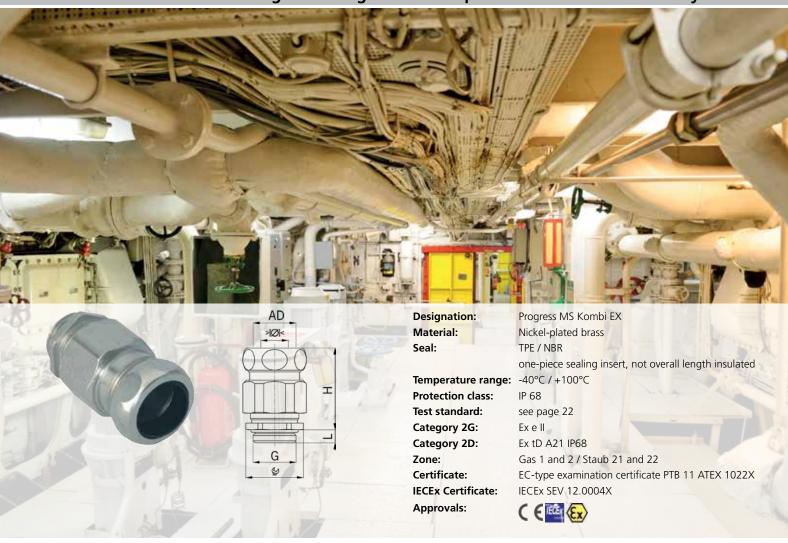

Testing standards

IEC 60079-0:2004 / EN 60079-0:2006 IEC 60079-7:2006 / EN 60079-7:2007 IEC 61241-0:2004 / EN 61241-0:2006

Available on request:

Long entry thread

Depending on the type of conduit, the stabilising bush must be ordered separately.

Warning: Only metallic conduits or conduits with metallic braiding may be applied!

Increased safety Ex e II

Principle

In the case of ignition protection with an increased safety type, operation is based on the equipment preventing an ignition of the explosive atmosphere which can also leak into the housing. The equipment may not reach temperatures which are above the temperature class of gases which could potentially arise in the place of use, and sparks caused by electrical or mechanical means may also not occur. This applies not only to normal operation but also during predictable malfunctions. In electrical machines, electrical-thermal testing is thus of particular importance. In operation, protection against overloading is essentially important to maintaining explosion protection.

Important design parameters

- Special protection requirements for non-insulated active components.
- Air and creepage gaps are dimensioned larger than is generally the case in industry. Special requirements apply to the IP protection classes which must be maintained.
- More stringent requirements apply to windings with mechanical stability and insulating capacity, and the windings must be protected against elevated temperatures.

Applications

Installation materials such as junction boxes and distribution boxes, terminal com-partments for heaters, storage batteries, transformers, inductive ballasts, electrical motors, squirrel cage induction motors, lighting fixtures.

Cable glands for increased safety are tested according to IEC/EN 60079-7 for the following points:

- mechanical design
- electrical-thermal testing

1 Entry threads

Progress® cable glands with entry threads in metric or Pg designs can be used with existing threads or, in the case of drilled through holes, with locknuts.

2 High distortion protection

The integrated retaining grooves in the lower part and in the sealing insert ensure protection against twisting.

3 Guaranteed sealing capability

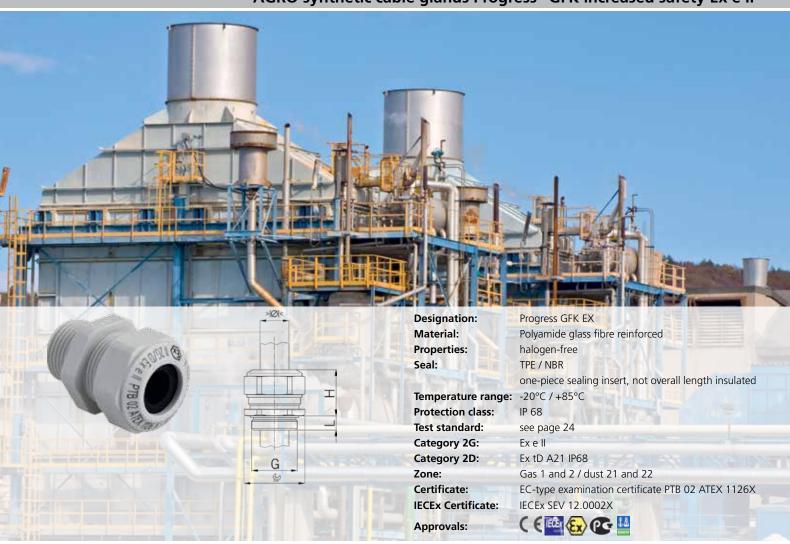

Inner contours matched to the sealing insert ensure a targeted deformation of the insert and guarantee a perfect seal.

Testing standards

IEC 60079-0:2004 / EN 60079-0:2006 IEC 60079-7:2006 / EN 60079-7:2007 IEC 61241-0:2004 / EN 61241-0:2006

Intrinsic safety Ex i II

Principle

A type of ignition protection in which the equipment contains intrinsically safe electrical circuits. An electrical circuit is intrinsically safe when neither a spark nor a thermal effect can cause the ignition of a given explosive atmosphere. The conditions for undisturbed operation and certain error conditions are established in this standard.

Different requirements apply for areas with combustible dust:

- Additional housing in Protection Class IP 6X if dust deposits can become a problem.
- The electrical circuit must be designed for at least Explosion Group IIB.

Important design parameters

- Selection of certain components for electrical and electronic circuits.
- Reduction of the allowable loading of the components compared to normal industrial applications with regard to
 - voltage because of electrical stability
 - current with respect to heating
- The voltage and current values, including a safety factor, are continually limited to such a low level that it is certain that excessive temperatures cannot arise, while sparks and electric arcs during interruptions or short circuits have so little energy that they are unable to ignite an explosive atmosphere.

Applications

Measurement, monitoring and information systems and equipment, sensors based on physical, chemical or mechanical principles and with limited power, and actuators based on optical, acoustic and to a limited extent also on mechanical principles.

AGRO cable glands are tested for increased safety, and through the marking with the blue housing they may also be used within intrinsically safe areas i II according to IEC / EN 60079-11

- mechanical design
- electrical-thermal testing

1 Entry threads

Progress® cable glands with entry threads in metric or Pg designs can be used with existing threads or, in the case of drilled through holes, with locknuts.

2 High distortion protection

The integrated retaining grooves in the lower part and in the sealing insert ensure protection against twisting.

3 Guaranteed sealing capability

Inner contours matched to the sealing insert ensure a targeted deformation of the insert and guarantee a perfect seal.

Testing standards

IEC 60079-0:2004 / EN 60079-0:2006 IEC 60079-7:2006 / EN 60079-7:2007 IEC 60079-11:2006 / EN 60079-11:2007 61241-0:2004 / EN 61241-0:2006

Accessories for Ex cable glands

Locking screws nickel-plated brass Ex d IIC

- with metric entry thread - with Pg entry thread

Art. no. 8710.XX

Locking rings nickel-plated brass for cable glands Ex d IIC

- with metric entry thread - with Pg entry thread

Art. no. 18XX.XX.50

Reduction fittings nickel-plated brass

- with metric entry thread - with Pg entry thread

Art. no. EX3500.XX.XX

Enlarging fittings nickel-plated brass

- with metric entry thread - with Pg entry thread

Art. no. EX3600.XX.XX

Locking screws nickel-plated brass Ex e II

- with metric entry thread - with Pg entry thread

Art. no. EX87XX.08

Locking screws synthetic Ex e II

- with metric entry thread - with Pg entry thread

Art. no. 8841.XX.

Locknuts nickel-plated brass/synthetics Locking pins synthetics

- with metric entry thread - with Pg entry thread

8300.XX / 82XX (grey) / 82XX.40 (black)

for Ex conformant closing up of unused

Certifications

You can find all certifications in the download area of our website **www.agro.ch**.

You can find our complete product line with all technical details in our catalogue and on the Internet at www.agro.ch.

Systems and solutions

for professional cable entry.

Syntec® cable glands made of plastic or brass are the optimal solution for your daily installation tasks. The patented, unique lamellar technology always guarantees cable routing with excellent strain relief.

Progress® cable glands made of plastic or metal are proven aids for professional cable routing in industrial plants. The excellent compression technology ensures tight seals and strain relief which is exceptionally easy on cables.

Progress® EMC cable glands made of brass ensure a low-impedance connection between the braided shield and the metal chassis while maintaining secure cable routing.

Progress® Ex cable glands made of plastic or brass ensure secure cable routing even in potentially explosive environments.

Elbows and flanges to add changes of direction in switching cabinets and chassis.

Accessories: locknuts, reduction fittings, locking screws, ...
